Public Consultation: Methodology Framework for Carbon Capture and Storage, Batch 2

VERRA

March 28, 2024

Matthias Krey (CCS+)

Engin Mert (CCS+)

Julie Aguko (Verra)
Jordan Kummerfield (Verra)

Ian Kuwahara (Verra)

John Sandoval (Verra)

Webinar Objectives

- **To present an overview of the proposed 2nd Batch of the VCS Carbon Capture and Storage Modules and Tools, including:**
  - Module for CO2 Capture from Bioenergy Combustion
  - Reductions & Removals tool
  - Non-VCS tool
  - Module for CO2 Storage in Saline Aquifers and Depleted Hydrocarbon Reservoirs

VERRA

Photo by FUNDAECO / REDD Conservation Coast Project

Agenda

1. Overview of Verra and the VCS Program
2. Methodology Development and Approval Process (MDRP)
3. CCS+ Initiative
4. Introduction to Batch 2 of the CCS Methodology Framework
5. Q&A

1. Verra and the VCS

- An overview of Verra and the VCS Program

VERRA

VERRA

Standards for a Sustainable Future

2007
Founded in 2007 by environmental and business leaders who saw the need for greater quality assurance in voluntary carbon markets

501(c)(3)
Registered nonprofit organization under Section 501(c)(3) of the U.S. Internal Revenue Code

110+
With approximately 110 staff and growing rapidly, Verra is headquartered in Washington, D.C., USA, with staff working remotely internationally

Verified Carbon Standard

The world's most widely used voluntary greenhouse gas program

VERRA

Impact

>2,100
projects

> 1.2 billion
carbon credits issued

Equivalent to the emissions of >260 coal-fired power plants in one year

Environmental Finance

Voluntary Carbon Market Rankings 2023 Winner

VCS: Best GHG Crediting Programme
2012, 2013, 2014, 2015, 2016, 2018, 2019, 2020, 2021, 2022, 2023

Verra Registry: Best Registry Provider
2021, 2022, 2023

VERRA

2. Methodology Development and Approval Process (MDRP)

- Procedure for Methodology Development at Verra

Methodology Idea Note submission for Verra review

Concept Note outlines proposed methodology elements (baseline, quantification, etc.)

Methodology development

Public Stakeholder Consultation - 30 day comment period

VVB Assessment of methodology and public consultation response

Verra Review of the methodology and VVB assessment report.-
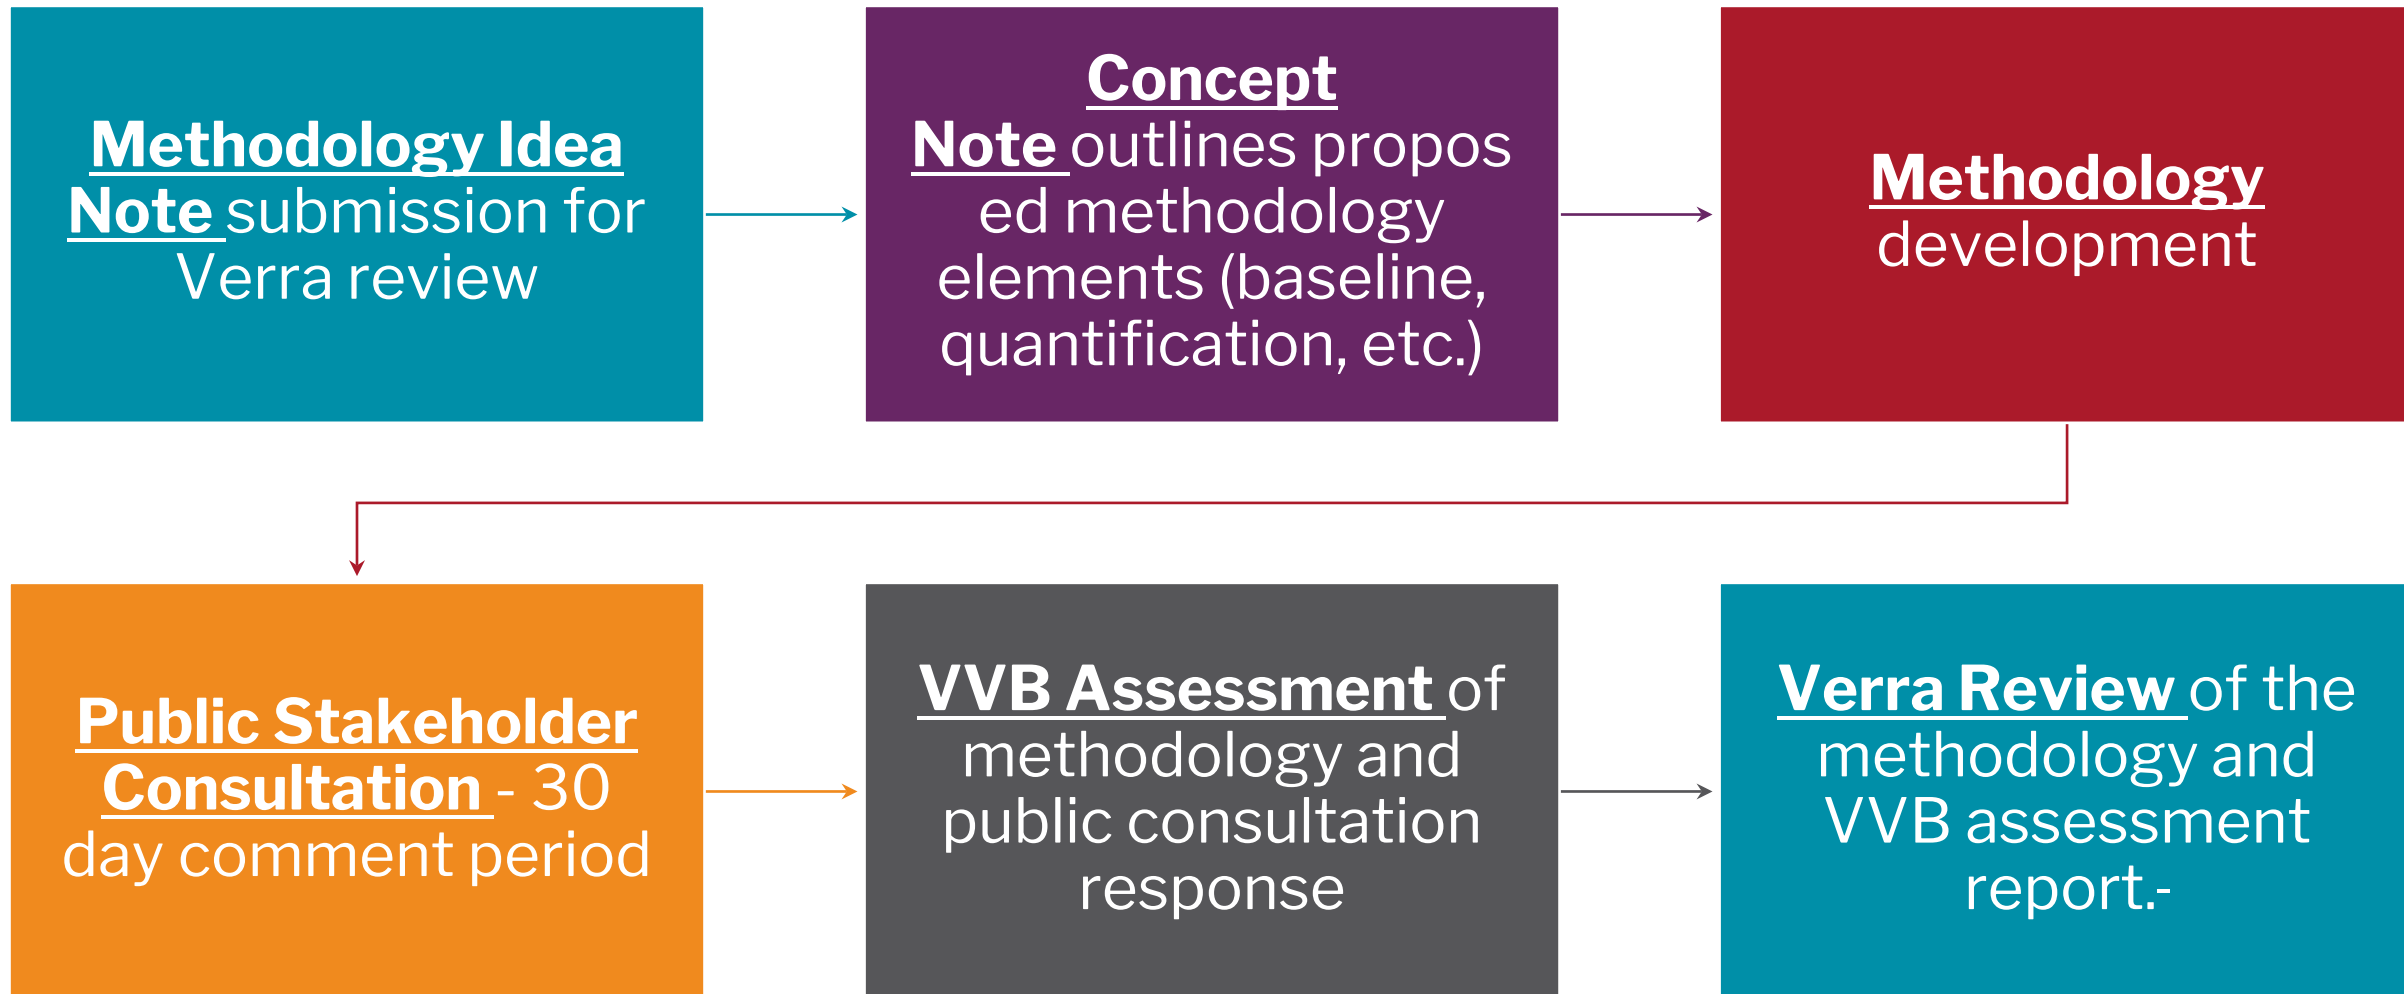

3. CCS+ Initiative

- Structure, objectives, workstream

VERRA

Mission

CCS+
initiative

The CCS+ Initiative aims to scale cutting edge climate technologies by developing a robust carbon accounting infrastructure that promotes environmental integrity. The CCS+ Initiative separately accounts for emissions reduction and carbon dioxide removal solutions.

In a nutshell

A unique approach

A high-quality integrated carbon accounting methodology infrastructure for the full suite of CCS, CCU(S) and tech CDR solutions.

Through collaboration

Developed by pooling funding and expertise in carbon markets, climate science and engineering, covering all use cases.

Creating a public good

Subject to public scrutiny, with the aim of creating a public good that adheres to the highest levels of environmental integrity.

Standard Setting Body — VERRA

Overarching modules

- Guidance and Principles
- CCS+ Methodology
- CCUS+ Methodology
- Tool for Differentiation between Emission Reductions and Removals in Carbon Capture Project Activities
- Tool for Baseline Quantification and Allocation of Project Emissions in Carbon Capture Project Activities

Capture modules

- Carbon Capture from Air
- Carbon Capture from Power and Heat
- Carbon Capture from Industrial Processes
- Carbon Capture from Oil and Gas Production and Processing
- Carbon Capture from Bioenergy

Transport modules

- Consolidated module for Transport via Pipeline, Ships, Road and Rail

Storage and use modules

- Geological Carbon Storage (in aquifers and in depleted oil and gas fields)
- Conversion of CO2 => CaCO3 for "construction" additives
- Mineralization of CO2 injected in the concrete production for ready mix and precast
- Injection of CO2 into the baking process to produce ceramics
- Admixture to cement, reducing clinker usage
- Storage in igneous rock formations by mineralisation
- CO2 storage in medium lifetime products, e.g. plastics
- CO2 utilization and storage in short lifetime products e.g. fuels
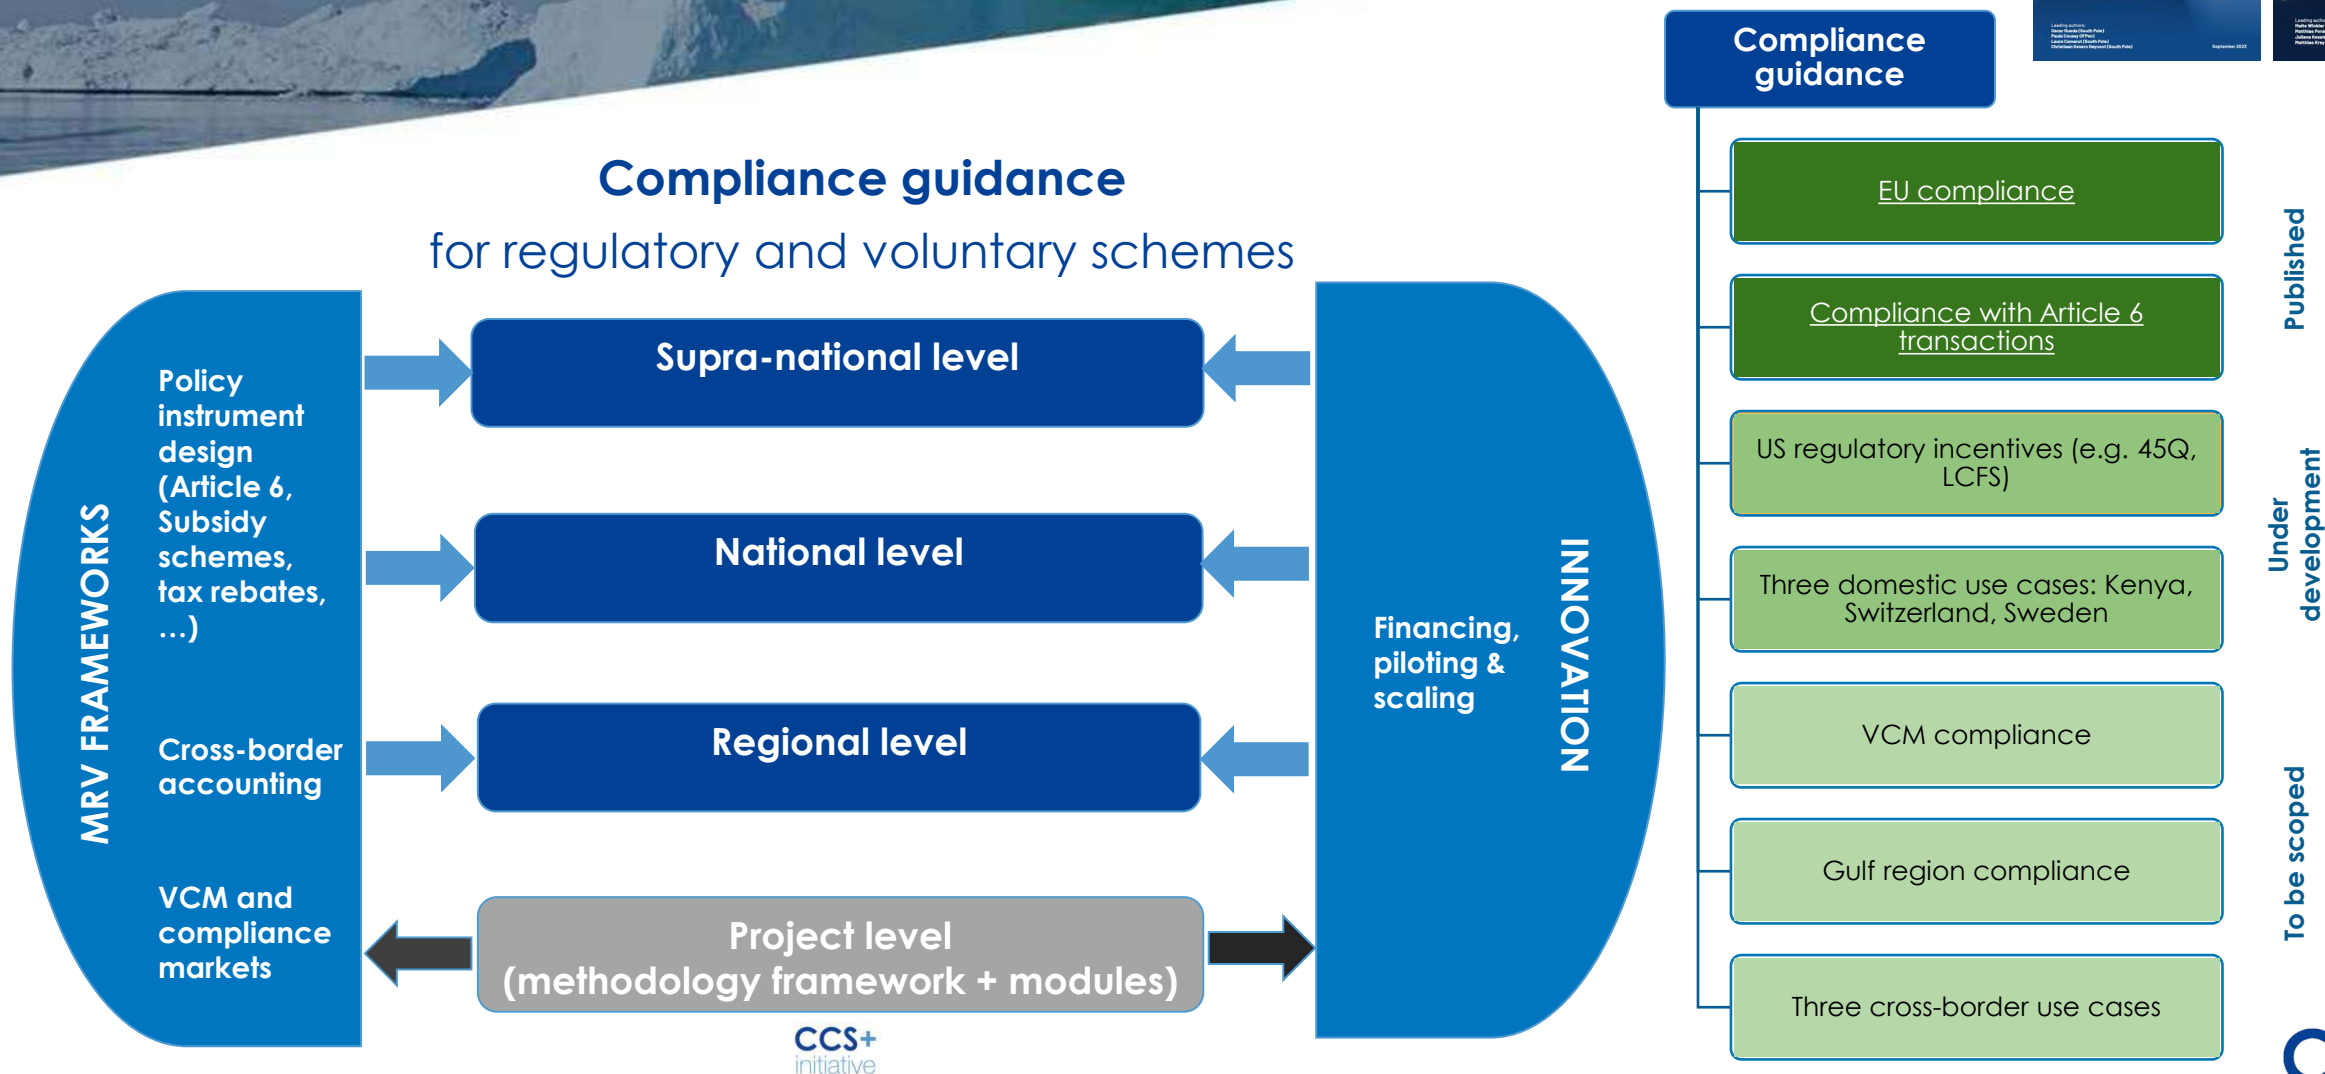

Modular approach

- **Modules** are grouped along the project value chain, i.e. capture or removal, transport, utilization and storage.

- **Staggered approach** to methodology and tool development, starting with the most mature and impactful use cases.

- **Additional modules** can be added where there is a technical overlap, conditional upon funding.

CCS+
initiative

Plug-and-play application

Approach for application of "methodology" to project activity

Step 1 – Framework Methodology

- Check if capture / removal, transport and storage technologies proposed are eligible under Methodology Frameworks

Step 2 – Capture Modules

- Select modules for the applicable capture / removal technologies

Step 3 – Transport Modules

- Select modules for the applicable transport technologies

Step 4 – Storage Modules

- Select modules for the applicable storage technologies

CCS+ initiative

Bridging markets

Compliance guidance
for regulatory and voluntary schemes

MRV FRAMEWORKS

- Policy instrument design (Article 6, Subsidy schemes, tax rebates, …)
- Cross-border accounting
- VCM and compliance markets

- Supra-national level
- National level
- Regional level
- Project level (methodology framework + modules)

INNOVATION — Financing, piloting & scaling

Compliance guidance

Published
- EU compliance
- Compliance with Article 6 transactions

Under development
- US regulatory incentives (e.g. 45Q, LCFS)
- Three domestic use cases: Kenya, Switzerland, Sweden
- VCM compliance

To be scoped
- Gulf region compliance
- Three cross-border use cases

CCS+ initiative

CCS+ initiative

4. Introduction – Batch 2 of the CCS Methodology Framework

Objectives:

- Expand the eligibility of CCS to projects capturing CO_2 from Bioenergy Combustion
- Safeguard the sustainability of biomass feedstocks
- Differentiate CO_2 reduction & removals in projects with both types of mitigation impacts.
- Facilitate the establishment of CCS hubs and shared infrastructure
- Expand storage options

Module for CO$_2$ Capture from Bioenergy Combustion (BECCS)

- Applies to bioenergy facilities producing heat and power
- Accounts for the removal of carbon dioxide from short-lived biogenic storage
- Covers emissions from biomass lifecycle
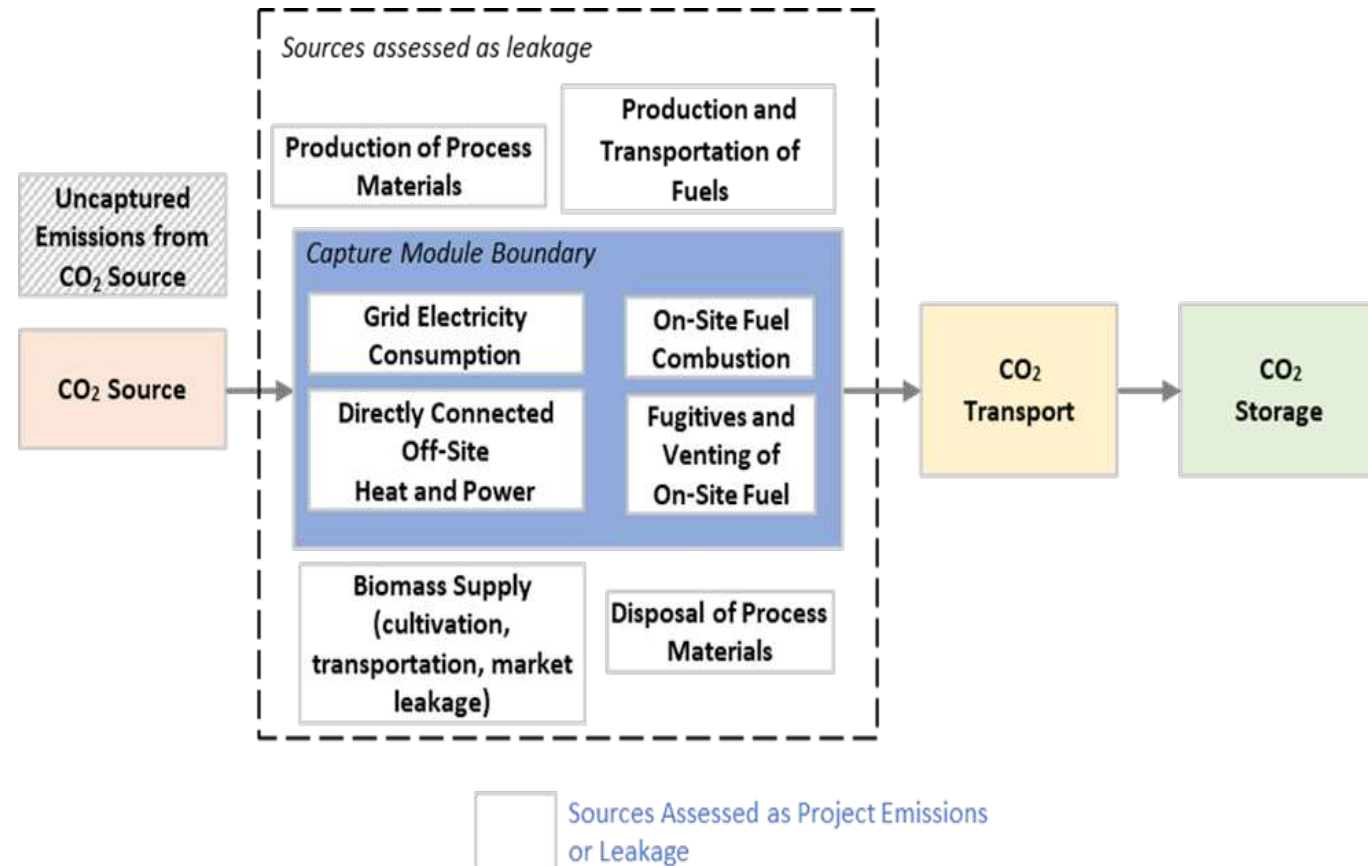

Requested feedback

BECCS:

1. In what ways could the proposed method for assessing project and leakage emissions associated with BECCS projects be improved?

2. Are there existing standards, regulations, or other sources that could provide guidance on better accounting for these emission sources, especially market leakage, from the use of biomass feedstocks?

3. In what ways could the proposed methods for differentiating baseline emissions and allocating project and leakage emissions between emission reductions and removals be improved?

Safeguards for Sustainable Biomass

Land use and biodiversity	Sustainable forest management	Soil health	Water
Food security	Social sustainability	LULUCF	Land-based leakage

Projects must:
- Demonstrate regulatory compliance or sustainability certification, and
- Maintain chain of custody documentation

VERRA

Sustainability safeguards:

1. What are the limitations or gaps in the current approach used to demonstrate the sustainability of biomass feedstocks and safeguarding against potential negative environmental and social impacts from their use?

2. What specific challenges or complexities do you anticipate in applying this approach in a global context?

Tool for Differentiating Reductions and Removals in CCS Projects

- Applies to projects with facilities dealing with mixed feedstocks
- Protects integrity and market signal for removals
- Incents a move away from non-traceable biomass

Multiple sources, each with a single feedstock type
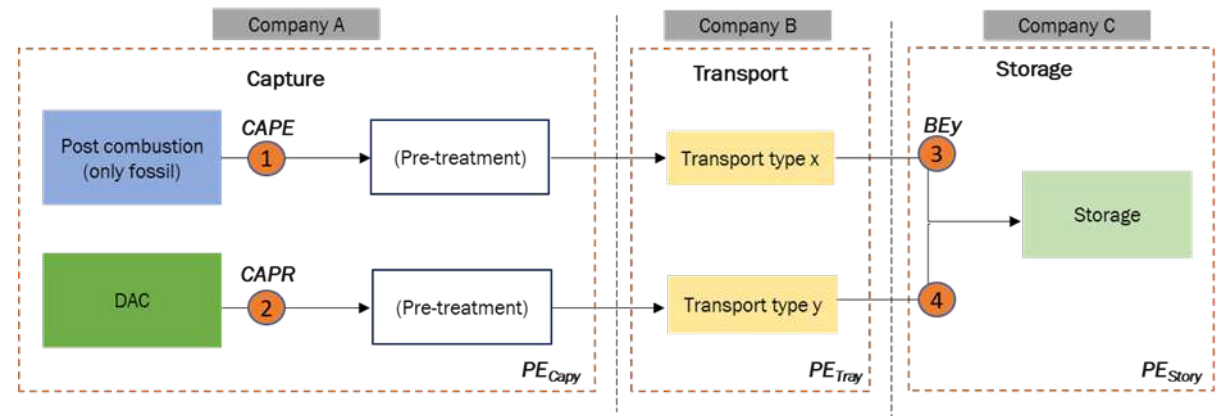

Multiple sources, each with mixed feedstock
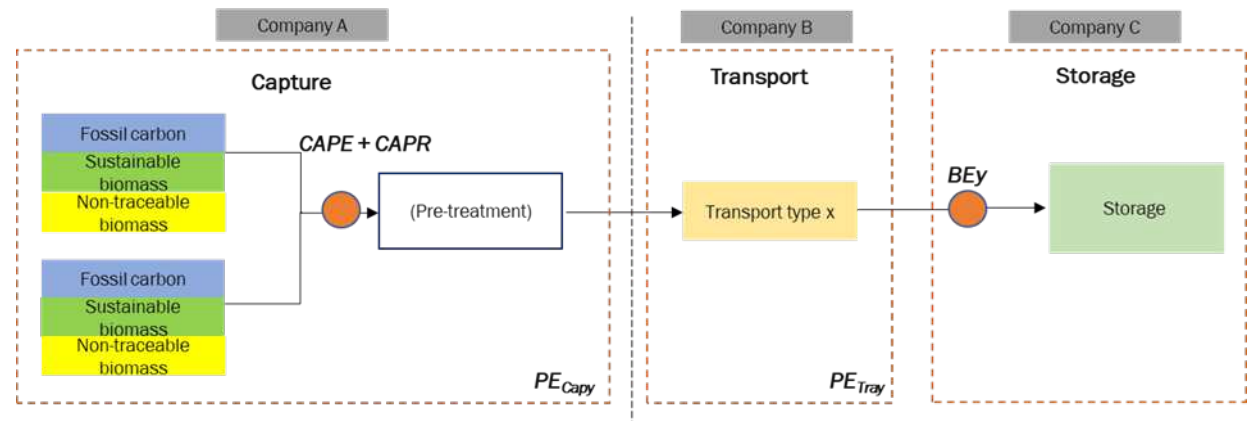

Reduction and Removals tool:

1. The tool seeks to incentivize projects to reduce the use of non-traceable biomass over time in two ways:

   - By discounting the reductions generated by projects that exceed a decreasing annual limit of non-traceable biomass consumption in the first crediting period, and

   - Making non-traceable biomass ineligible to generate reductions after that.

   Do you believe this approach is adequate to incentivize the reduction of non-traceable biomass use over time? If not, are there any adjustments or considerations you would suggest? Is this approach equitable or will some projects experience outsized impacts?

Tool for Accounting Non-VCS CO2 in CCS Projects

o *Applies to projects with facilities dealing with VCS and Non-VCS CO_2*

o *Allocates project and leakage emissions to both*

o *Supports the development of shared infrastructure*
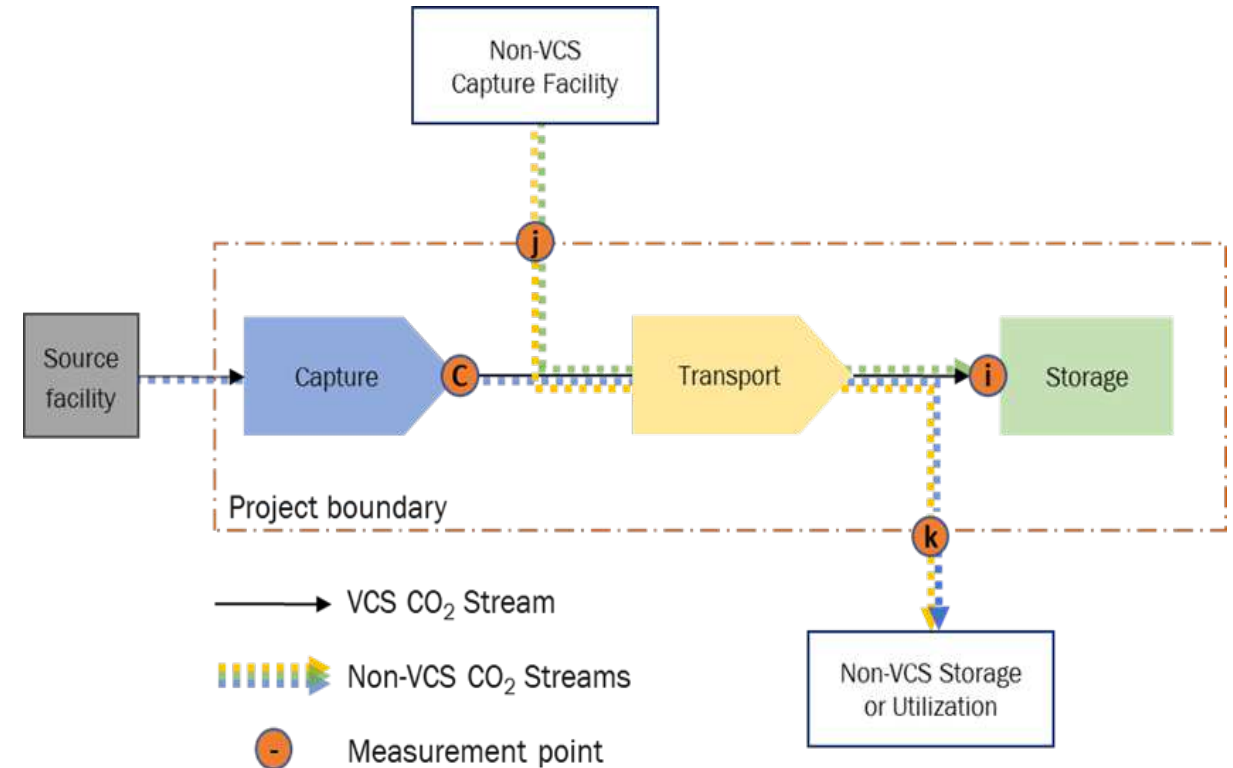

Non-VCS tool:

1. In what ways could the procedures for quantifying the allocation of project emissions and leakage emissions for projects involving captured CO_2 that is not eligible for crediting in the VCS be improved? What specific challenges or complexities do you anticipate in applying this approach?

2. Option 1 of the non-VCS tool, allocates all project and leakage emissions to the VCS CO_2 stream. How confident are you in the accuracy and reliability of this approach? Are there any potential drawbacks or limitations to consider when applying Option 1, particularly in cases where non-VCS CO_2 emissions may be significant?

Module for CO2 Storage in Saline Aquifers and Depleted Hydrocarbon Reservoirs

- *Applies to projects that store CO_2 in:*
  - *Saline Aquifers or,*
  - *Depleted Hydrocarbon reservoirs*
- *Module was updated based on public consultation*
- *Expands storage options*
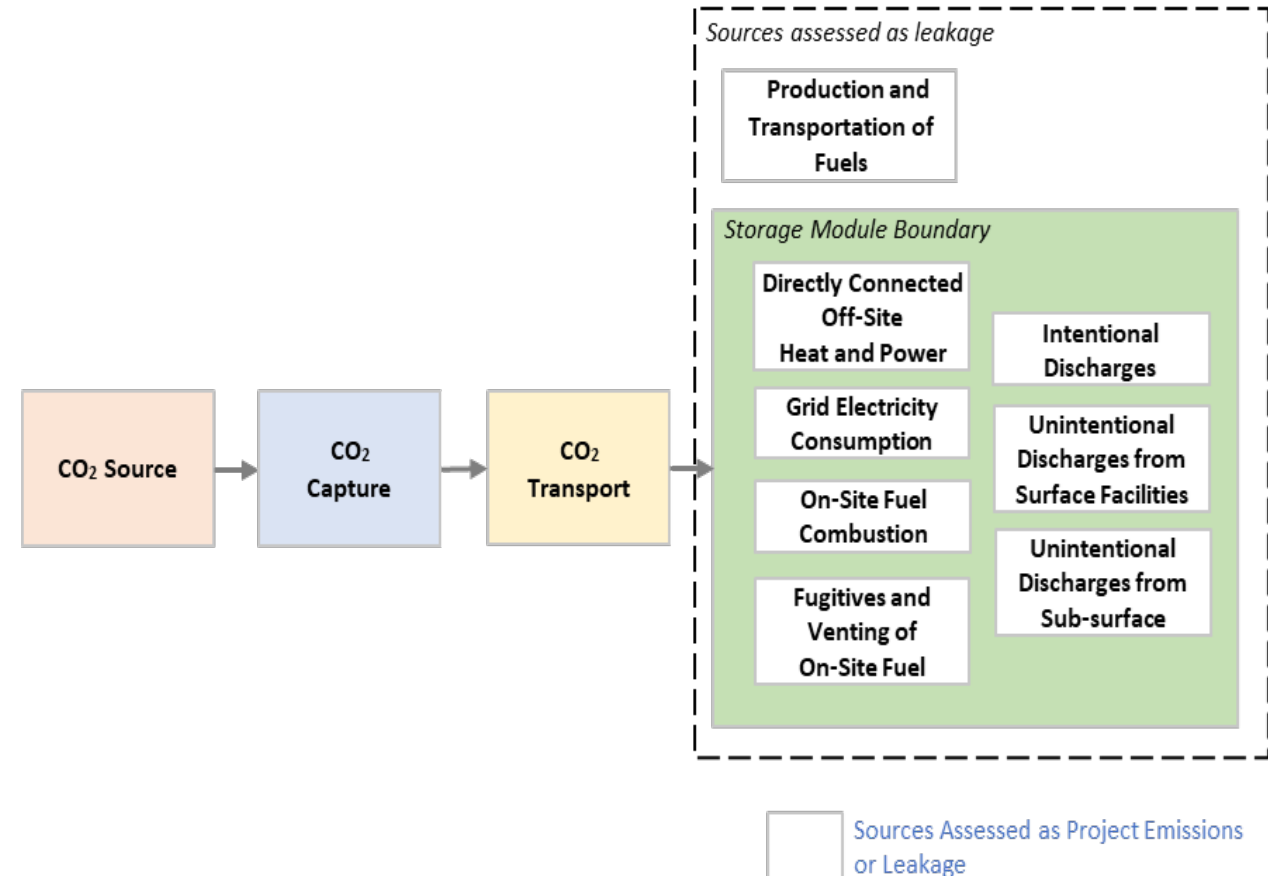

Requested feedback

Storage:

1. Do the revised definitions for 'Depleted Hydrocarbon Reservoir' and 'Legacy Wells' improve the clarity and operational guidance of the storage module? Please provide specific feedback on their applicability and any areas for further refinement.

2. How does the exclusion of certain CO_2 Injection activities affect the comprehensiveness of the CCS+ methodology? Are there any considerations that may have been overlooked in determining these exclusions?

3. Please suggest any best practices or methodologies for the monitoring of CH_4 emissions from depleted Hydrocarbon Reservoirs. Additionally, do you agree with the inclusion of this requirement in the framework?

4. Are the new monitoring plan requirements sufficiently comprehensive to ensure the permanent storage of CO_2?

Public Comment Period

- Available at [Public Consultation: Carbon Capture and Storage Tools and Modules](#)

- Open for public comment from **1 March - 15 April**

- Submit comments to *methodologies@verra.org*

Next Steps for Batch 2

March 1 to April 15	Consultation period
May 2024	Modules revised per input from consultation
Q3 2024	Module validation
Late 2024	Revised modules and tools publication

Ongoing or Future Work Related to CCS

Related to this draft methodology:

- Please see existing requirements document:
  - *Methodology for Carbon Capture and Storage* documents
  - *Geologic Carbon Storage (GCS) Requirements* document
  - *GCS Non-Permanence Risk Tool* document
- *Draft consultation for program changes* related to:
  - Embodied carbon and construction emissions (particularly relevant to DACCS project activities)
- Potential future updates related to CCS work:
  - An electricity tool for making consistent measurement of electrical energy consumption and providing guidelines for 'purpose-built green PPAs'
  - VCS definition for sustainable biomass and requirements for sustainable feedstock sourcing
